

Rehab Brandon

Rehab Brandon - EECp therapy is an outpatient treatment used for heart failure and angina. For individuals who suffer from these conditions, simple activities like walking the dog or getting the mail can be very tough. If you or somebody you know experiences heart failure or angina, the non-invasive treatment referred to as EECp therapy can prove useful. Statistics show that approximately 80% of patients who complete the 35 hour course of EECp therapy report significant symptom relief that can last up to 3 years.

EECP therapy has been proven beneficial for heart failure and angina treatment. Treatments could be given for an hour a day, up to 5 days a week for as much as 35 hours. A treatment will often require lying on a table making use of big blood pressure like cuffs wrapped round your legs and buttocks. At particular times in between your heartbeats, these cuffs deflate and inflate. A continuous ECG or also called electro cardiogram is utilized to be able to set the timing. This insures that the cuffs inflate while the heart is in its resting state where it normally receives its blood and oxygen supply. Then the cuffs deflate at the end of that rest period, just before the next heartbeat. The person wears a special sensor on their finger to monitor the oxygen levels in their blood. The sensor also checks the pressure waves created by the cuff deflations and inflations.
